Supplementary Information

Supplementary Figure S1. *T. gondii* infection activates the mRNA expression of *Mif* in BMDMs.

(A) BMDMs were infected with *T. gondii* RH strain (moi = 1) for the indicated time periods and then cell lysate was collected. The mRNA expression for *Mif* and *actb* was determined using semiquantitative RT-PCR (top) or quantitative real-time PCR analysis (qPCR; bottom) analysis. (B and C) BMDMs were infected with *T. gondii* RH strain (moi = 0.2, 0.5, and 1) for 18 h. (B) Cell lysates were subjected to SDS-PAGE, followed by western blot analysis using anti-MIF and anti-β-tubulin Abs. (C) The mRNA expression for *Mif* and *actb* was determined using semiquantitative RT-PCR (top) or qPCR (bottom) analysis. Data are representative of three independent experiments and are presented as means ± SD. ***P < 0.001, two-tailed Student’s t-test.

Supplementary Figure S2. Knockdown of MIF in macrophages leads to an increased expression of *sag1* mRNA.

BMDMs were transduced with lentiviruses expressing shNS or shMIF (at MOI of 1, 5, and 20 for top or 5 for bottom) for 48 h with polybrene (8 μg/mL) and then infected with *T. gondii* RH strain for 18 h. The mRNA expression for *Mif* and *actb* was determined using semiquantitative RT-PCR (top). qPCR were assessed to determine *sag1* mRNA expression in whole-cell lysates (bottom).

Supplementary Figure S3. *T. gondii* infection induces the generation of hydrogen peroxides in BMDMs.

BMDMs were infected with *T. gondii* RH strain (moi=1) for indicated times and then stained with
H2DCFDA (20 μM) for 20 min. Intracellular ROS generation was measured using a fluorescence microscope. Scale bar = 100 μm. H$_2$O$_2$ (1 mM, 30 min) was used for positive control.

**Supplementary Figure S4.** *T.gondii* infection enhances NF-κB transcriptional activity in Raw 264.7 cells in a time- or moi-dependent manner.

(A and B) Raw 264.7 cells were transfected with plasmids carrying NF-κB luciferase reporter constructs before *T.gondii* RH strain (moi = 1, for A; indicated moi, for B) for various time periods (for A) or 18 h (for B). Luciferase assays were performed based on normalization to the β-galactosidase activity. Data are representative of three independent experiments and are presented as means ± SD. *P < 0.05, **P < 0.01, ***P < 0.001, two-tailed Student’s t-test.

**Supplementary Figure S5.** Analysis of the mRNA expression of various surface receptors on *T.gondii*-infected *Nox4*+/+ and *Nox4*−/− BMDMs.

(A-C) BMDMs from *Nox4*+/+ and *Nox4*−/− mice were infected with *T.gondii* RH strain (moi = 1) for the indicated time periods and then cell lysate was collected. The mRNA expression for *Il1r1* (for A), *Ccr5* (for B), and *Tlr4* (for C) were determined using qPCR analysis. Data are representative of three independent experiments and are presented as means ± SD. *P < 0.05, ***P < 0.001, two-tailed Student’s t-test.

**Supplementary Figure S6.** Nox4-deficient mice exhibit an impaired production of inflammatory cytokine TNFα in response to *T.gondii* ME49 strain infection.

(A and B) *Nox4*+/+ and *Nox4*−/− mice (n = 5 per genotype) were infected with 40 cysts of *T.gondii*
ME49 strain (i.p. injection) for 20 days. Levels of Serum TNFα (for A) and IL-12p40 (for B) from $\text{Nox4}^{+/-}$ and $\text{Nox4}^{-/-}$ mice were assessed by ELISA analysis. ***$P < 0.001$, compared with $\text{Nox4}^{+/-}$ mice infected with $T.gondii$ (two-tailed Student’s t-test).
